

How do you consider the current rules and regulations fair? Cable is not regulated with regard to there broadband services. Why should the local RBOC's be? Why should they invest in new and improved technologies if they are forced to sell it to competitors at a price that is below what it cost them to put it in? Everybody is afraid that if the RBOC's are not regulated completion will suffer, but the cable companies are the dominant provider of broadband services in the US. The only way you can spur true competition, that is good for the economy, is to encourage CLEC's to build there own faculties. Until then you are living in a fantasyland and everything is make believe.
